Soldering, a meticulous craft, often suffers from inefficient and cumbersome wire feeders. Hand soldering is a widely used technique in various industries, including electronics manufacturing, automotive, aerospace, and many others. It involves joining components and wires by melting a solder wire, creating a strong and reliable electrical connection. However, hand soldering can be a challenging and time-consuming process, requiring a steady hand and precise control over the solder wire. The project focuses on the development of a solder wire feeder, to address limitations of existing solutions and improve the hand soldering process. This innovative tool integrates a solder wire feeding mechanism into a hand-based device, providing controlled and consistent delivery of solder wire during soldering operations. with Featuring adjustable feed rate, integrated timer control, ergonomic design, and cost-effectiveness.
